if you ask most americans what they think about the fbi they would tell you it s far and away the government agency they trust the most the bureau has for decades sold an image of itself as efficient professional unbiased and untouchable by corruption that portrait is a sham seamus bruner and the government accountability institute have spent years cataloging the widespread conflict of interests of the d c political class they have found massive self enrichment and political bias at the highest levels of government including the justice department and the fbi indeed the nation s most important law enforcement agency has become so compromised that every major investigation should face intense scrutiny from the public the media and from congress james comey robert mueller andrew mccabe and the rest of the recent fbi leadership should be forced to answer for the way the bureau has abused the public trust under their watch

this book offers an analysis of the four central regional security themes relevant to the policy focussed discussions at the annual iiss shangri la dialogue namely the evolving roles of the united states and china in asia pacific security responses by the us and regional states to regional security tensions particularly in the south china sea emerging security questions relating to nuclear weapons missiles and military cyber capabilities the prospects for regional security cooperation including the challenges for the asean centred architecture

this book develops a new approach in explaining how a nation s grand strategy is constituted how to assess its merits and how grand strategies may be comparatively evaluated within a broader framework the volume responds to three key problems common to both academia and policymaking first the literature on the concept of grand strategy generally focuses on the united states offering no framework for comparative analysis indeed many proponents of us grand strategy suggest that the concept can only be applied at most to a very few great powers such as china and russia second characteristically it remains prescriptive rather than explanatory ignoring the central conundrum of why differing countries respond in contrasting ways to similar pressures third it often understates the significance of domestic politics and policymaking in the formulation of grand strategies emphasizing mainly systemic pressures this book addresses

these problems it seeks to analyze and explain grand strategies through the intersection of domestic and international politics in ten countries grouped distinctively as great powers the g5 regional powers brazil and india and pivotal powers hostile to each other who are able to destabilize the global system iran israel and saudi arabia the book thus employs a comparative framework that describes and explains why and how domestic actors and mechanisms coupled with external pressures create specific national strategies overall the book aims to fashion a valid cross contextual framework for an emerging research program on grand strategic analysis

in modeling turbulent reactive flows probability density function pdf methods have an advantage over the more traditional moment closure schemes in that the pdf formulation treats the chemical reaction source terms exactly while moment closure methods are required to model the mean reaction rate the common model used is the laminar chemistry approximation where the effects of turbulence on the reaction are assumed negligible for flows with low turbulence levels and fast chemistry the difference between the two methods can be expected to be small however for flows with finite rate chemistry and high turbulence levels significant errors can be expected in the moment closure method in this paper the ability of the pdf method and the moment closure scheme to accurately model a turbulent reacting flow is tested

bridge deck simulators bdss 6 in 15 cm concrete cubes with an embedded temperature probe are intended as a cost effective substitute for rwis pavement sensors to represent conditions likely on bridge decks in an area near an rwis station in this study the effectiveness of the bdss to predict the temperature on nearby bridge decks was evaluated nine sites were selected by odot across the state of ohio six in northeastern region and three in southwestern region which were instrumented with bdss and nu metrics pavement sensors on the bridge deck and with one exception on the road surface off the bridge the use of bdss appears to be unique to ohio a

survey in the state of ohio indicated little use was being made of bds information rwis temperature data collected at five minute intervals during winter season 2004 2005 were analyzed and the unusable data were weeded out by removing redundant entries blank or incomplete entries extreme temperature readings and entries where sensor data were not updated correlation analysis was performed on the cleaned data from the nine sites for the air and bds temperatures versus bridge deck and road temperatures and also for air versus bds temperatures separate correlations were made with all day data and with nighttime data free of solar radiation effects for both all day and nighttime data the bds was found to better correlate with bridge deck and road temperatures than was the air temperature the nighttime data were then further analyzed to determine 90 95 99 prediction limits for the prediction of bridge deck and road temperatures based on the bds and air temperature values again the prediction limits for bridge and road temperatures using the bds were generally tighter than when using air temperature finite element analyses fea were performed for the nine sites using algor v18 software to investigate the temperature behavior of the bridge deck and the bds for the air temperature profiles reflecting extreme positive and negative temperature gradients recorded at each site the fea modeling provided information about how the bds and the bridge deck temperature change as a function of the air temperature and time larger concrete cube sizes up to 24 in 61 cm on a side were investigated with fea in an exploratory manner the 24 in 61 cm cube almost exactly matched the simulated bridge deck temperature profiles under a variety of air temperature loads the fea temperature profiles showed that the existing bds does not always closely represent the true temperature behavior of the bridge deck but that a concrete cube 4 times larger on a side would compare much better yearly training of maintenance personnel in the use of the bds and rwis is recommended
