1. Stress and Strain Fundamentals Understanding how materials respond internally to external loads begins with the concepts of stress and strain.
 - Stress: The internal force per unit area within a material. Types include normal stress (tensile or compressive) and shear stress.
 - Strain: The deformation or displacement resulting from stress, expressed as a ratio or percentage. Hibbeler emphasizes the importance of the stress-strain relationship and introduces the elastic modulus, Poisson's ratio, and yield criteria.
2. Axial Loading This is the simplest form of loading, where a member is subjected to tensile or compressive forces along its length.
 - Stress due to axial load: $\sigma = P/A$
 - Deformation: $\Delta L = (PL)/(AE)$
 The section includes analysis of bars under axial load, thermal effects, and combined loading.
3. Torsion of Circular Members Torsion involves twisting a member, producing shear stresses.
 - Torsion formula: $\tau = (Tr)/J$
 - Angle of twist: $\phi = (TL)/(GJ)$
 Applications include shafts, axles, and drive shafts.
4. Bending of Beams Bending involves applying moments to create curvature in beams.
 - Normal stress in bending: $\sigma = (My)/I$
 - Deflection calculations: Using the double integration method or moment-area theorems. Design considerations include maximum bending stress and deflection limits.
5. Combined Loading Real-world components often experience multiple load types simultaneously.
 - Superposition principle: Sum of individual effects
 - Principal stresses: Maximum and minimum normal stresses at a point Hibbeler discusses failure theories such as the maximum shear stress theory and von Mises criterion.
