elliptical trainers provide strenuous exercise for large muscle groups with less ground force reaction than running the reduced ground force makes an elliptical trainer bout a potential alternative to the 1.5 mi run in the U.S. Navy Physical Readiness Test (PRT). This alternative could reduce the risks associated with testing particularly for individuals who otherwise might receive a medical waiver for that portion of the PRT. Previous investigations established the feasibility of elliptical trainer testing for life fitness. CT 9500HR machines. The present investigation examined two additional machines: Precor EX 556 and Nautilus EG16. Because lifestyle fitness machines are not available at all potential test sites, the lifestyle fitness investigations indicated that calorie reports from the elliptical trainers predicted 1.5 mi run time after allowing for a positive bias in the reports. An algorithm to convert elliptical trainer performance to equivalent run time was developed. The present investigation compared Precor and Nautilus machines to the lifestyle fitness machine. These machines provide biased estimates of calorie expenditure. The size of the bias was the only difference between machines. The test algorithm developed for the life fitness machine should accurately convert Nautilus and Precor calorie reports to run times after adjusting for bias differences.

The Eclipse elliptical machine is undoubtedly the most popular elliptical machine within many people's budget. Cost limit on the market that is why you must go into your purchase with this knowledge of the Eclipse machines and price points. The Eclipse elliptical machine starts at three hundred and forty-nine dollars and only increases by fifty bucks for the following highest model.

The purpose of this study was to examine the influence of incline of an elliptical trainer on the physiological responses during submaximal exercise and to also compare these responses between two different elliptical trainers with different movement and incline patterns. Twelve healthy subjects completed a maximal graded exercise test and a submaximal exercise test consisting of 14 minutes of exercise at 60% peak oxygen consumption ( $\text{VO}_2\text{peak}$ ), seven minutes at 0% incline followed by 14 minutes of exercise at 80%  $\text{VO}_2\text{peak}$ , seven minutes at 100% incline followed by 14 minutes of exercise at 80%  $\text{VO}_2\text{peak}$ , seven minutes at 0% incline, seven minutes at 100% incline. During submaximal exercise, oxygen consumption, respiratory exchange ratio, heart rate, and ratings of perceived exertion were all significantly greater when exercising at a 100% incline versus a 0% incline. During exercise on the Ascent trainer, sEMG activity of the vastus lateralis was

significantly lower at 0 incline compared to 100 incline while there was no difference between 0 and 100 incline when exercising on the standard elliptical however overall semg activity was significantly higher during exercise of the standard elliptical compared to the ascent trainer in conclusion exercising at 100 incline on a elliptical trainer imposes a greater physiological stress on the individual compared to exercise at 0 incline in addition the motion and incline pattern used by the ascent trainer is more effective at increasing recruitment of the vastus lateralis compared to the standard elliptical trainer
