self organisation self regulation self repair and self maintenance are promising conceptual approaches for dealing with complex distributed interactive software and information handling systems self organising applications dynamically change their functionality and structure without

direct user intervention responding to changes in requirements and the environment this is the first book to offer an integrated view of self organisation technologies applied to distributed systems particularly focusing on multiagent systems the editors developed this integrated book with three aims to explain self organisation concepts and principles using clear definitions and a strong theoretical background to examine how self organising behaviour can be modelled analysed and systematically engineered into agent behaviour and to assess the types of problems that can be solved using self organising multiagent systems the book comprises chapters covering all three dimensions synthesising up to date research work and the latest technologies and applications the book offers dedicated chapters on concepts such as self organisation emergence in natural systems software agents stigmergy gossip cooperation and immune systems the book then explains how to engineer artificial self organising software in particular it examines methodologies and middleware infrastructures finally the book presents diverse applications of self organising software such as constraint satisfaction trust management image recognition and networking the book will be of interest to researchers working on emergent phenomena and adaptive systems it will also be suitable for use as a graduate textbook with chapter summaries and exercises and an accompanying website that includes teaching slides exercise solutions and research project outlines self organisation self regulation self repair and self maintenance are promising conceptual approaches for dealing with complex distributed interactive software and information handling systems self organising applications dynamically change their functionality and structure without direct user intervention responding to changes in requirements and the environment this is the first book to offer an integrated view of self organisation technologies applied to distributed systems particularly focusing on multiagent systems the editors developed this integrated book with three aims to explain self organisation concepts and principles using clear definitions and a strong theoretical background to examine how self organising behaviour can be modelled analysed and systematically engineered into agent behaviour and to assess the types of problems that can be solved using self organising multiagent systems the book comprises chapters covering all three dimensions synthesising up to date research work and the latest technologies and applications the book offers dedicated chapters on concepts such as self organisation emergence in natural systems software agents stigmergy gossip cooperation and immune systems the book then explains how to engineer artificial self organising software in particular it examines methodologies and middleware infrastructures finally the book presents diverse applications of self organising software such as constraint satisfaction trust management image recognition and networking the book will be of interest to researchers working on emergent phenomena and adaptive systems it will also be suitable for use as a graduate textbook with chapter summaries and exercises and an accompanying website that includes teaching slides exercise solutions and research project outlines

during the last thirty years biophysicist and philosopher henri atlan has been a major voice in contemporary european philosophical and bio ethical debates in a massive oeuvre that ranges from biology and neural network theory to spinoza s thought and the history of philosophy and from artificial intelligence and information theory to jewish mysticism and to contemporary medical ethics atlan has come to offer an exceptionally powerful philosophical argumentation that is as hostile to scientism as it is attentive to biology s conceptual and experimental rigor as careful with concepts of rationality as it is committed to rethinking the human place in a radically determined yet forever changing world book jacket

self organization is a generic term describing the capacity of a system to change its own structure by itself while interacting with the environment in this sense self organization is not environment determined or environment adaptive but is self determined and self adaptive the concept of self organization was born in the 1960s and attempts were made to establish a theory based on the logic of a system and its control in contrast the 1980s introduced a view based on the logic of creative individuals and on fluctuations antithetical differences exist between the two the former regards the system of aggregated individuals as the object of consideration where self organization is the sum of the practices of a system led by control or self control in particular the latter focuses on the practices of individuals deviating from the logic of a system making the existing system fluctuate and transforming its structure this volume attempts to integrate these viewpoints through inquiry into the structure of the self and through self reflexion a new horizon thus opens for the synthesis of planning control action theory and spontaneous performative action theory

self organization constitutes one of the most important theoretical debates in contemporary life sciences the present book explores the relevance of the concept of self organization and its impact on such scientific fields as immunology neurosciences ecology and theories of evolution historical aspects of the issue are also broached intuitions relative to self organization can be found in the works of such key western philosophical figures as aristotle leibniz and kant interacting with more recent authors and cybernetics self organization represents a notion in keeping with the modern world s discovery of radical complexity the themes of teleology and emergence are analyzed by philosophers of sciences with regards to the issues of modelization and scientific explanation the implications of self organization for life sciences are here approached from an interdisciplinary angle revealing the notion as already rewarding and full of promise for the future

this book provides an interdisciplinary approach to complexity combining ideas from areas like complex networks cellular automata multi agent systems self organization and game theory the first part of the book provides an extensive introduction to these areas while the second explores a range of research scenarios lastly the book presents cellnet a software framework that offers a hands on approach to the scenarios described throughout the book in light of the introductory chapters the research chapters and the cellnet simulating framework this book can be used to teach undergraduate and master s students in disciplines like artificial intelligence computer science applied mathematics economics and engineering moreover the book will be particularly interesting for ph d and postdoctoral researchers seeking a general perspective on how to design and create their own models

traditionally the open systems approach has been used to describe communication structures and processes this book does not deal with social systems from this perspective rather it examines self organizing systems models that seek to explain the emergence of patterns of behavior in systems that are initially in a state of disorganization this volume examines the models currently under development autopoiesis catastrophe theory fractal geometry dissipative structures complexity theory cellular automata and artificial intelligence and presents a number of applications to contemporary communication theory
