introduction to computing and algorithms prepares students for the world of computing by giving them a solid foundation in the study of computer science algorithms by taking an algorithm based approach to the subject this book helps readers grasp overall concepts rather than getting them bogged down with specific syntax details of a programming language that can become obsolete students work with algorithms from the start and apply these ideas to real problems that computers can help solve the benefit of this approach is that students will understand the power of computers as problem solving tools learn to think like programmers and gain an appreciation of the computer science discipline

this easy to follow textbook provides a student friendly introduction to programming and algorithms emphasis is placed on the threshold concepts that present barriers to learning including the questions that students are often too embarrassed to ask the book promotes an active learning style in which a deeper understanding is gained from evaluating questioning and discussing the material and practised in hands on exercises although r is used as the language of choice for all programs strict assumptions are avoided in the explanations in order for these to remain applicable to other programming languages features provides exercises at the end of each chapter includes three mini projects in the final chapter presents a list of titles for further reading at the end of the book discusses the key aspects of loops recursions program and algorithm efficiency and accuracy sorting linear systems of equations and file processing requires no prior background knowledge in this area

modern optimization approaches have attracted an increasing number of scientists decision makers and researchers as new issues in this field emerge different optimization methodologies must be developed and implemented the handbook of research on emergent applications of optimization algorithms is an authoritative reference source for the latest scholarly research on modern

this book addresses two main themes the first is the discipline of informatics two major questions will be discussed how can we obtain and keep track of a systematic and objective overview of the vast landscape in higher informatics education both nationally and internationally and would it be useful to rationalize and redesign the informatics curricula leading to less fragmentation and more communality the second theme is the relation between informatics and other disciplines with the following main questions what informatics do we need to offer a coherent curriculum which suits the needs of the actual information society with respect to specific disciplines what is relevant in informatics and cit to provide to others and what informatics concepts methods and techniques form the hard core needed in every other discipline

courses in computer programming combine a number of different concepts from general problem solving to mathematical precepts such as algorithms and computational intelligence due to the complex nature of computer science education teaching the novice programmer can be a challenge innovative teaching strategies and new learning paradigms in computer programming brings together pedagogical and technological methods to address the recent challenges that have developed in computer programming courses focusing on educational tools computer science concepts and educational design this book is an essential reference source for teachers practitioners and scholars interested in improving the success rate of students

by bringing together various current directions software project management in a changing world focuses on how people and organizations can make their processes more change adaptive the selected chapters closely correspond to the project management knowledge areas introduced by the project management body of knowledge including its extension for managing

software projects the contributions are grouped into four parts preceded by a general introduction part i fundamentals provides in depth insights into fundamental topics including resource allocation cost estimation and risk management part ii supporting areas presents recent experiences and results related to the management of quality systems knowledge product portfolios and global and virtual software teams part iii new paradigms details new and evolving software development practices including agile distributed and open and inner source development finally part iv emerging techniques introduces search based techniques social media software process simulation and the efficient use of empirical data and their effects on software management practices this book will attract readers from both academia and practice with its excellent balance between new findings and experience of their usage in new contexts whenever appropriate the presentation is based on evidence from empirical evaluation of the proposed approaches for researchers and graduate students it presents some of the latest methods and techniques to accommodate new challenges facing the discipline for professionals it serves as a source of inspiration for refining their project management skills in new areas

what does it mean to be human in a world increasingly determined by algorithms how can fiction articulate identity and subjectivity in the face of technology which seeks to reduce us to raw data these questions drive a growing body of fiction about our contemporary moment written by authors whose interests extend beyond simply writing about digital culture on a surface level but who seek to delve into the computational constructs which underpin it through readings of novels by joshua cohen nicola barker and neal stephenson and a visual novel developed by grasshopper manufacture digital culture in contemporary fiction offers the first analysis of the representation of computational algorithms and their cultural consequences in twenty first century fiction harrison theorizes a new cultural moment in which he places these authors one characterized by a turn in software development towards incorporating models derived from behavioural psychology and vitally fuelled by an abundance of data throughout its readings digital culture in contemporary fiction traces how each author gestures towards the literary and philosophical hermeneutics of algorithms and in doing so defines an emerging tradition of fiction attempting to redefine the novel
